

Step 2: Separation + ROC

We need to pick a threshold (vertical line on the plot)

Everything right of that threshold is classified as **signal**, everything left is classified as **background**

Let's start with a threshold at BDT output = 1

Our **background** rejection would be 100% but our **signal** efficiency would be 0%

This is the ROC top left

Sliding that threshold to -1 draws the ROC

Similar ROCs for **training** and **testing** is another sign we haven't overtrained!

We aim for high *Separation* & *A*

Separation >30% and $A > 0.85$ isn't too bad! 🍌

Step 2: Separation + ROC

Step 2: Separation + ROC

We need to pick a threshold (vertical line on the plot)

Step 2: Separation + ROC

We need to pick a threshold (vertical line on the plot)

Everything right of that threshold is classified as **signal**, everything left is classified as **background**

Step 2: Separation + ROC

We need to pick a threshold (vertical line on the plot)

Everything right of that threshold is classified as **signal**, everything left is classified as **background**

Let's start with a threshold at BDT output = 1

Step 2: Separation + ROC

We need to pick a threshold (vertical line on the plot)

Everything right of that threshold is classified as **signal**, everything left is classified as **background**

Let's start with a threshold at BDT output = 1

Our **background** rejection would be 100% but our **signal** efficiency would be 0%

Step 2: Separation + ROC

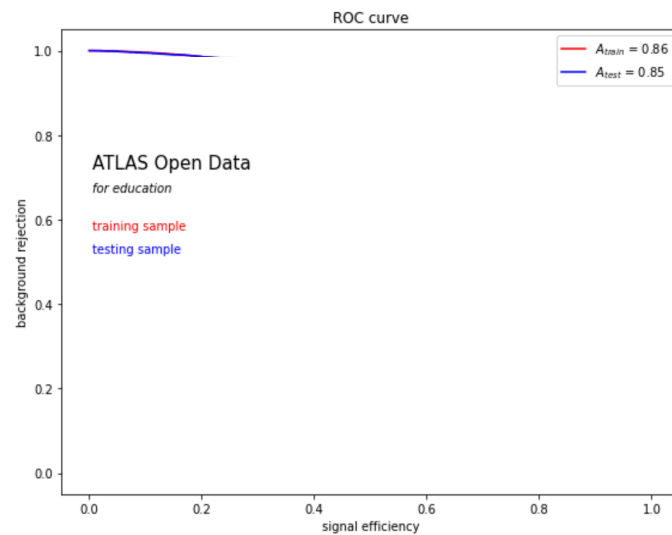

We need to pick a threshold (vertical line on the plot)

Everything right of that threshold is classified as **signal**, everything left is classified as **background**

Let's start with a threshold at BDT output = 1

Our **background** rejection would be 100% but our **signal** efficiency would be 0%

This is the ROC top left

Step 2: Separation + ROC

We need to pick a threshold (vertical line on the plot)

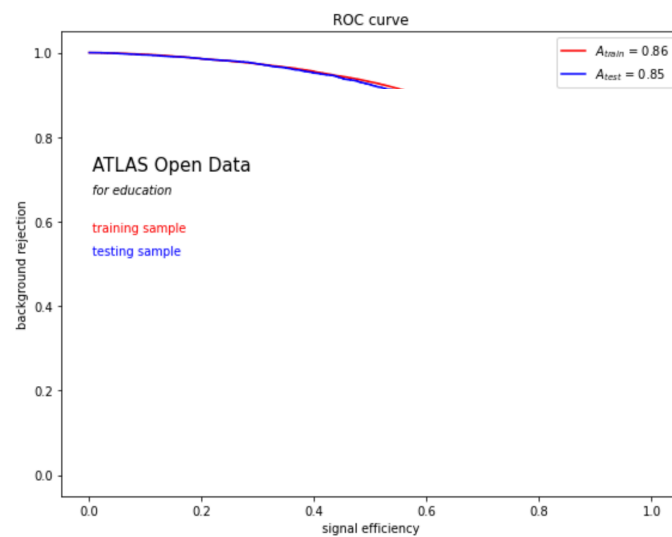

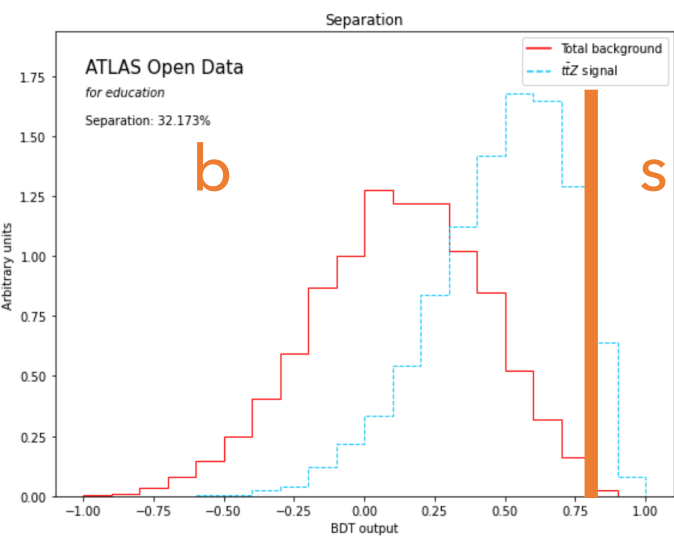

Everything right of that threshold is classified as **signal**, everything left is classified as **background**

Let's start with a threshold at BDT output = 1

Our **background** rejection would be 100% but our **signal** efficiency would be 0%

This is the ROC top left

Sliding that threshold to -1 draws the ROC

Step 2: Separation + ROC

We need to pick a threshold (vertical line on the plot)

Everything right of that threshold is classified as **signal**, everything left is classified as **background**

Let's start with a threshold at BDT output = 1

Our **background** rejection would be 100% but our **signal** efficiency would be 0%

This is the ROC top left

Sliding that threshold to -1 draws the ROC

Step 2: Separation + ROC

We need to pick a threshold (vertical line on the plot)

Everything right of that threshold is classified as **signal**, everything left is classified as **background**

Let's start with a threshold at BDT output = 1

Our **background** rejection would be 100% but our **signal** efficiency would be 0%

This is the ROC top left

Sliding that threshold to -1 draws the ROC

Step 2: Separation + ROC

We need to pick a threshold (vertical line on the plot)

Everything right of that threshold is classified as **signal**, everything left is classified as **background**

Let's start with a threshold at BDT output = 1

Our **background** rejection would be 100% but our **signal** efficiency would be 0%

This is the ROC top left

Sliding that threshold to -1 draws the ROC

Step 2: Separation + ROC

We need to pick a threshold (vertical line on the plot)

Everything right of that threshold is classified as **signal**, everything left is classified as **background**

Let's start with a threshold at BDT output = 1

Our **background** rejection would be 100% but our **signal** efficiency would be 0%

This is the ROC top left
